

- Manufacturers of Reflective & Polyester Insulation require a dead air-space around duct work. The air-space increases the R-Value and we provide it with the Ez -Strip Spacer™.
- Easy to install with double sided tape already attached to the Ez-Strip Spacer™
- The Ez-Strip Spacer™ provides the ideal quality continuous air space equally around all sides of the duct, with it's open truss design also on round and spiral ducts
- We provide the ability to wrap fittings and plenums with the required airspace
- Ez-Strip Spacer™ system insures the ducts integrity with its continuous rail open truss design down the ducts edges. And it will provide a solid base to hang the ducts, or run them across the attic joists.
- On larger ducts add an Ez-Strip Spacer™ down the center to insure the integrity of the insulation and not collapse the required airspace.
- Each Ez-Strip Spacer™ is 2 feet long and comes packed 20 to a box ,and can be cut with a snip to your desired length.
- The Manufacturer of Reflectix insulation suggest placing spacers every 24 to 36 inches
